River Otter or Sea Otter?

You can encounter both otters in salt water. How do you tell them apart?

- *Sea Otters float on their backs, River Otters don't.*
- *In the water, River Otters are always active and moving quickly.*
- *Sea Otters are clumsy on land and rarely seen on shore. River Otters are agile both in and out of the water.*

That's a Sea Otter!

Diet

Fish, fish fish!

Crustaceans, insects, amphibians and occasionally birds and small mammals can be part of the diet as well.

Small prey is eaten at the water's surface, large prey is taken to shore.

Range

Reproduction

Breeding takes place from December-April. 1-5 blind, helpless pups are born in an on-shore den between February and April. Pups are raised into adulthood by the mother. At two months old she teaches her playful pups to swim.

Social Groups

Family Group (Female with offspring)

Males can form groups of 2-17 individuals
